Methylation As a Cancer Biomarker

DNA Methylation contributes to the progression of carcinogenesis by silencing of tumor suppressor genes

(J.G. Herman & S. Baylin, *New England Journal of Medicine*, 2003)

Abnormal epigenetic changes appear to be **an early event** before detection of genetic mutations. Thus, detection of promoter methylation is a promising approach for **early diagnosis of cancer**.

Current Method for Promoter Methylation Detection

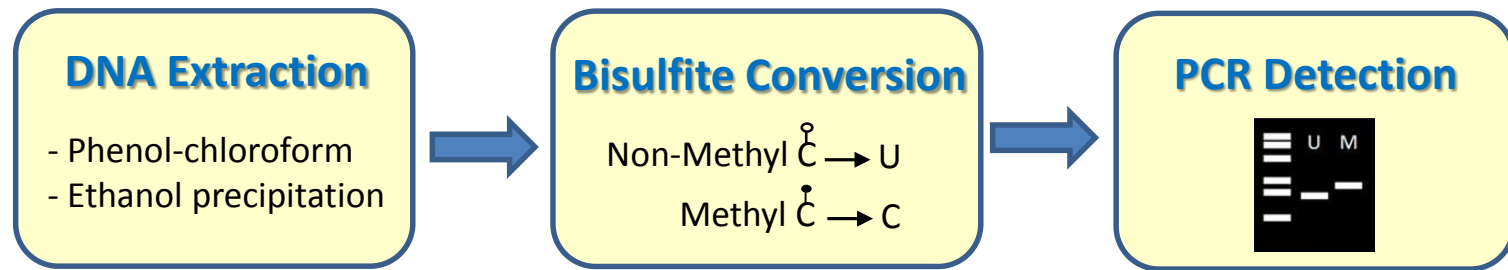

Proc. Natl. Acad. Sci. USA
Vol. 93, pp. 9821–9826, September 1996

Methylation-specific PCR: A novel PCR assay for methylation status of CpG islands

(DNA methylation/tumor suppressor genes/*p16/p15*)

JAMES G. HERMAN*[†], JEREMY R. GRAFF*, SANNA MYÖHÄNEN*, BARRY D. NELKIN*, AND STEPHEN B. BAYLIN*[‡]

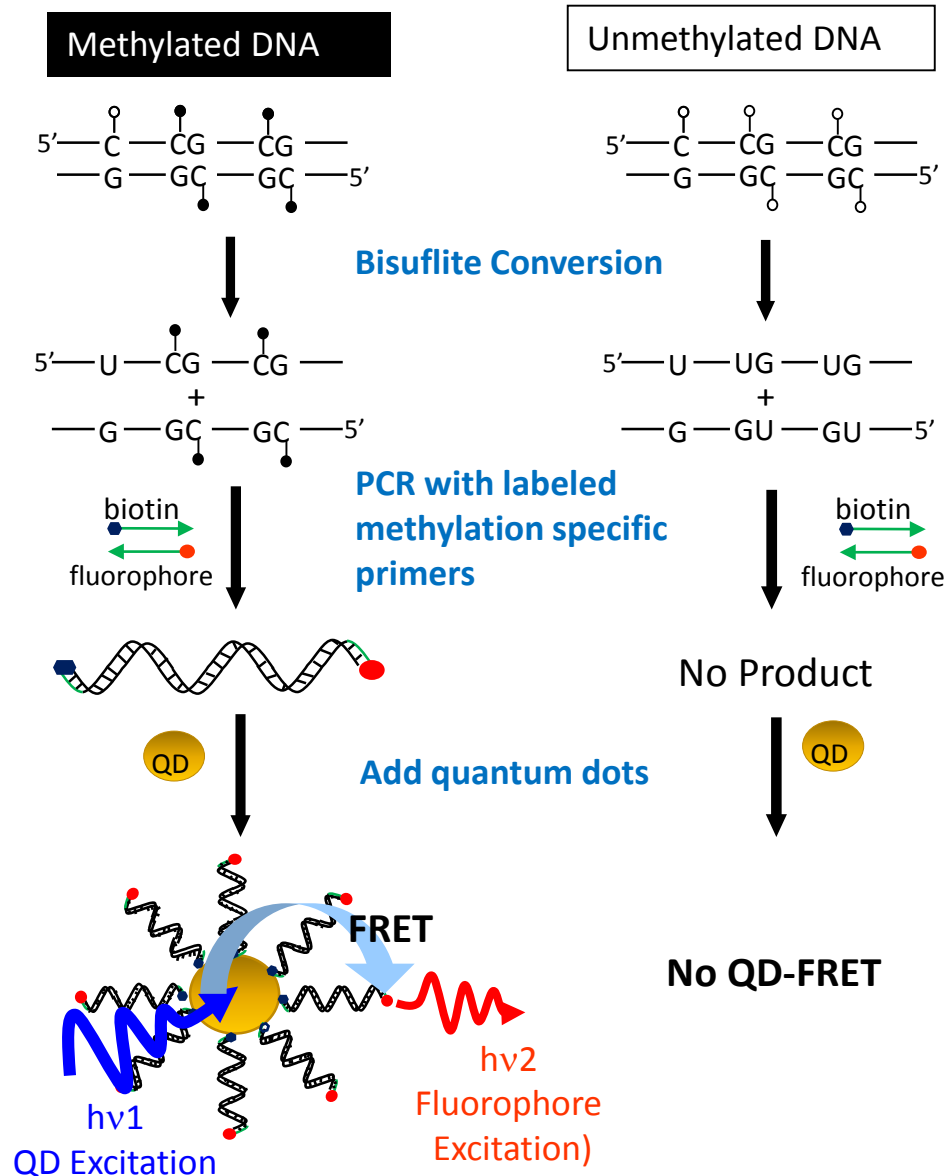

*Oncology Center and [‡]Department of Medicine, The Johns Hopkins Medical Institutions, 424 North Bond Street, Baltimore, MD 21231

Advantages: High sensitivity and specificity

- Limitations:**
- Still not sensitive enough to reliably detect methylated DNA in body fluids such as serum, sputum, stool and urine (requiring nested PCR, digital PCR).
 - Tedious and labor-intensive process which is not amenable for routine clinical utilizations.
 - Sub-optimal efficiency in recovery of circulating DNA

MS-qFRET: Methylation-Specific QD-FRET for DNA Methylation Detection

Quantum Dot-Fluorescence Resonance Energy Transfer (QD-FRET) DNA Nanosensor

1

1. Reporter probe
Cy5

2. Capture probe
Biotin

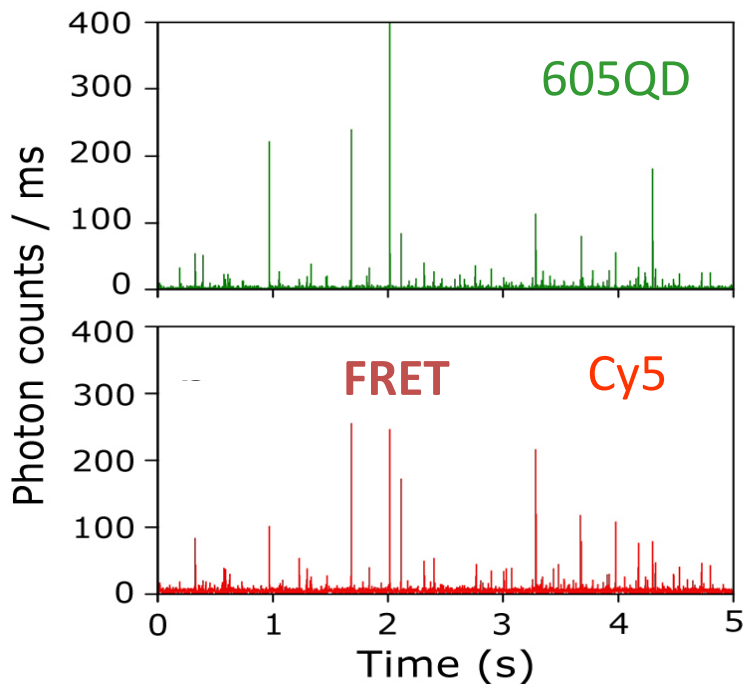

Streptavidin-conjugated QD

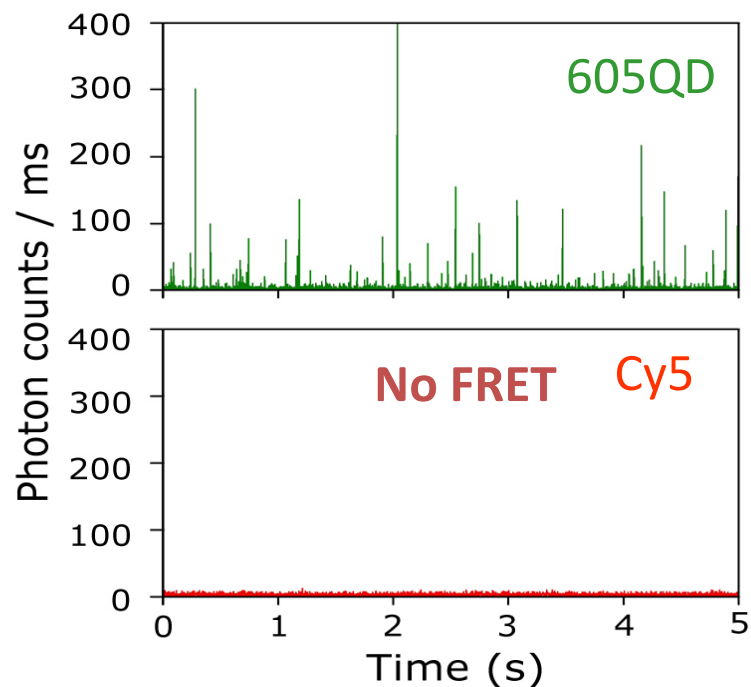

2

Single-molecule/nanoassembly Detection

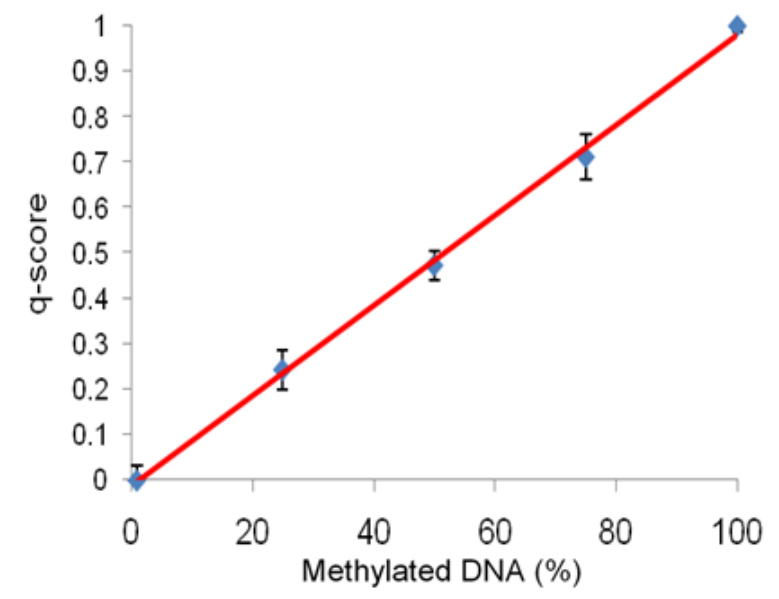

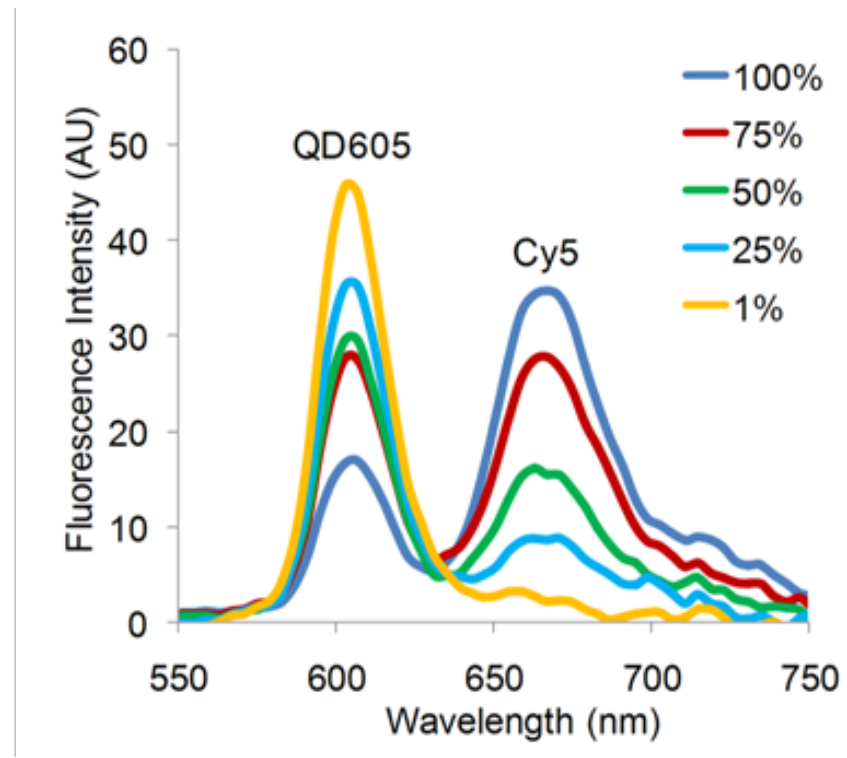

In the presence of targets

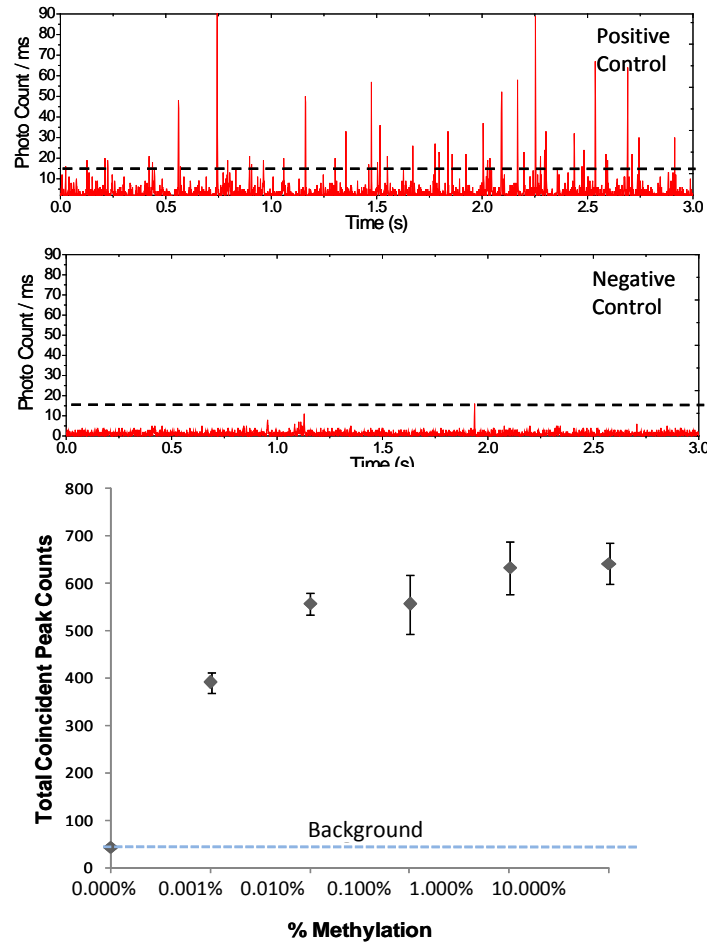

In the absence of targets

Quantitative Analysis of DNA Methylation Detection with QD-FRET Nanosensor

DNA Methylation Detection with QD-FRET Nanosensor

Analysis with clinical (sputum) samples

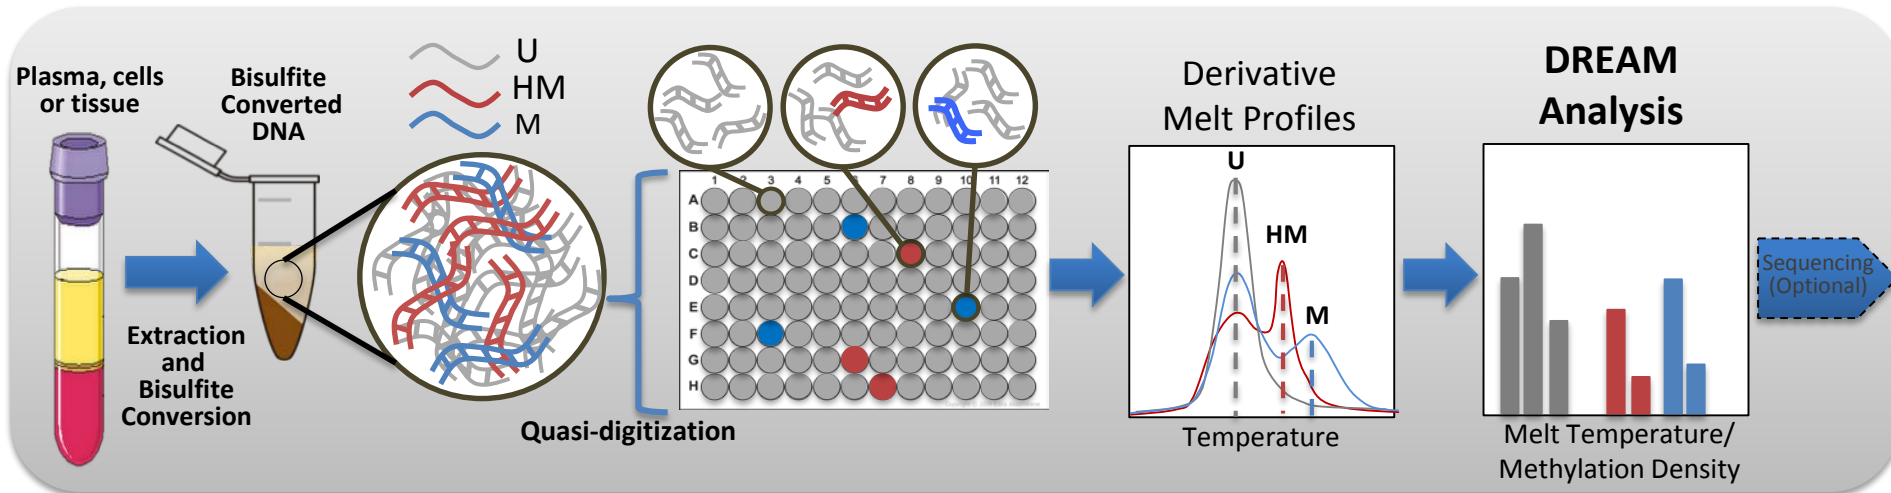

Detection limit:

- Detect methylated DNA in the presence of 10,000 excess of unmethylated alleles
- 15 pg DNA (5 genomic equivalents)

DREAMing

Discrimination of Rare EpiAlleles by Melt

- Cancers comprise heterogeneous populations of cells at primary and metastatic sites.
- DREAMing uses quasi-digital detection and precise melt curve analysis to distinguish *individual copies* of epiallelic species at *single-CpG-site resolution*

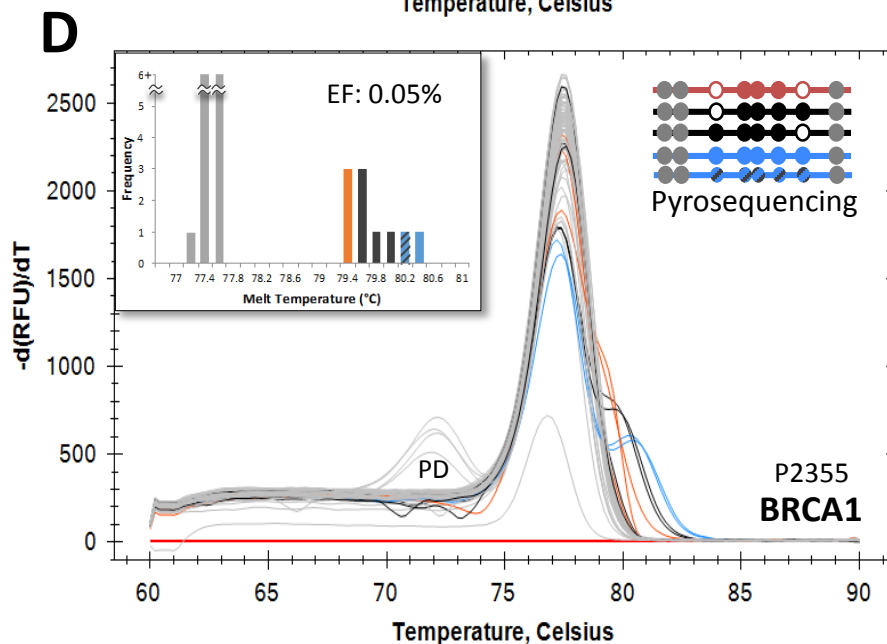

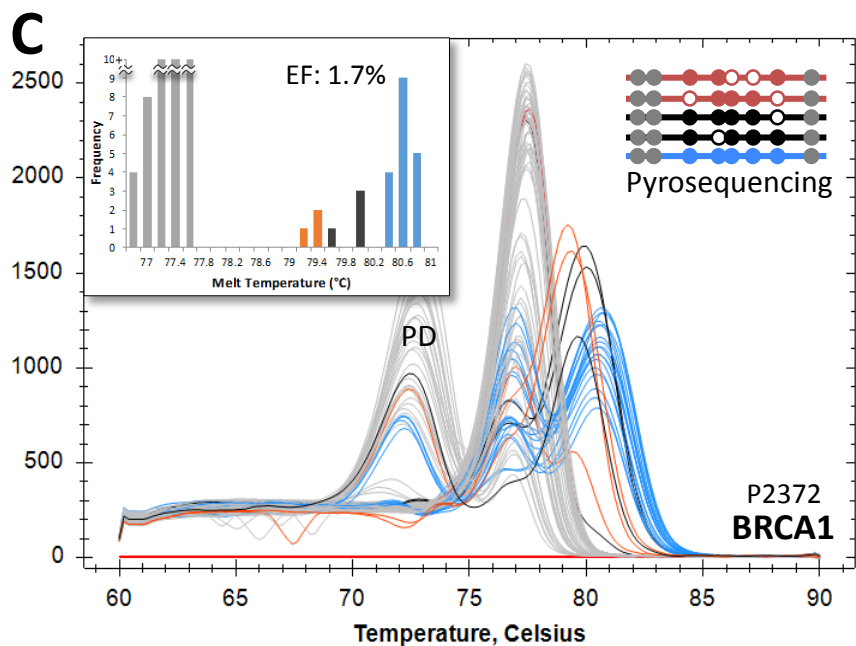

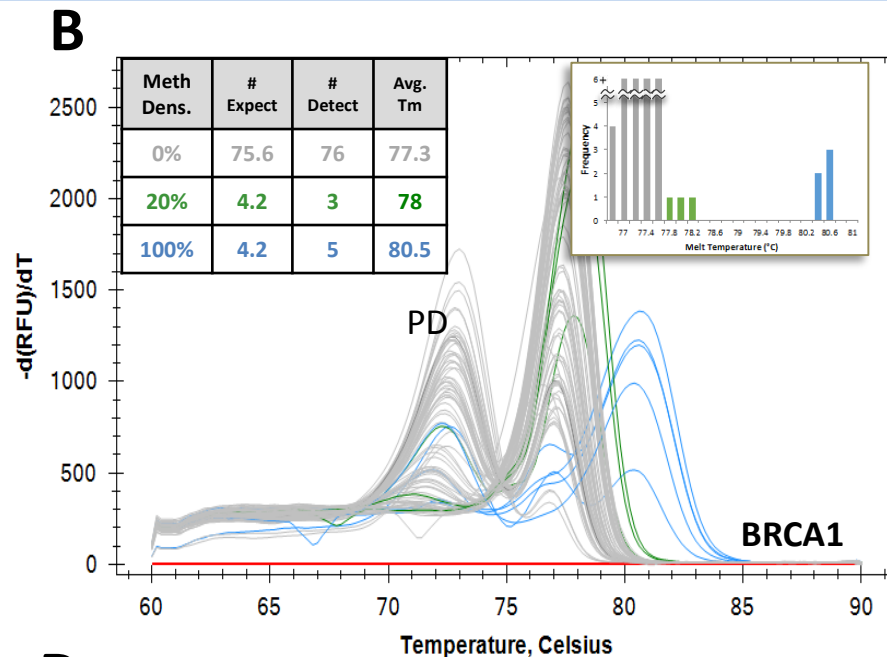

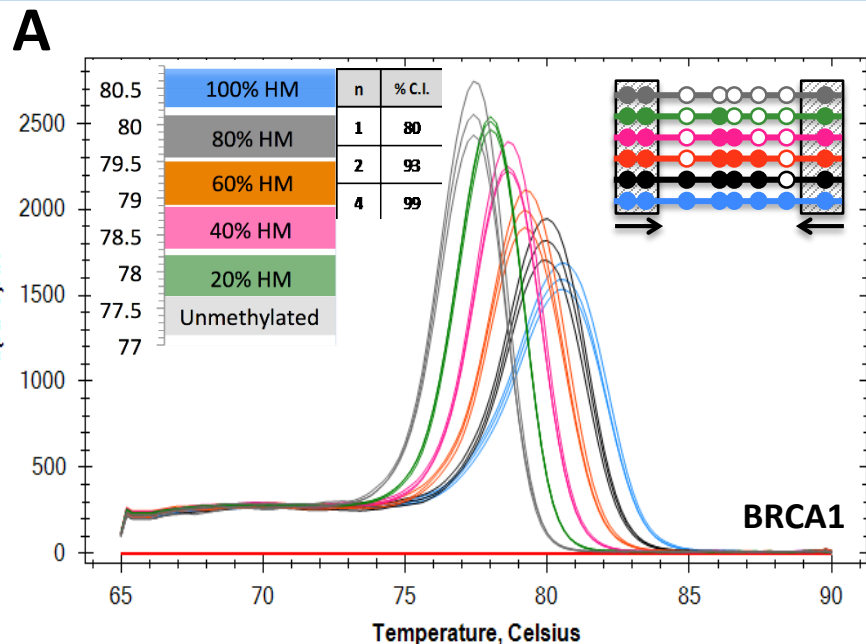

Discrimination of Epiallelic Variants Based on Melt Temperature

Bisulfite DNA conversion

Assessment of *BRAC1* Epigenetic Heterogeneity MDS/MPN Patient Samples

Microfluidic Array Chip for Digital Melt Analysis of Methylation Heterogeneity

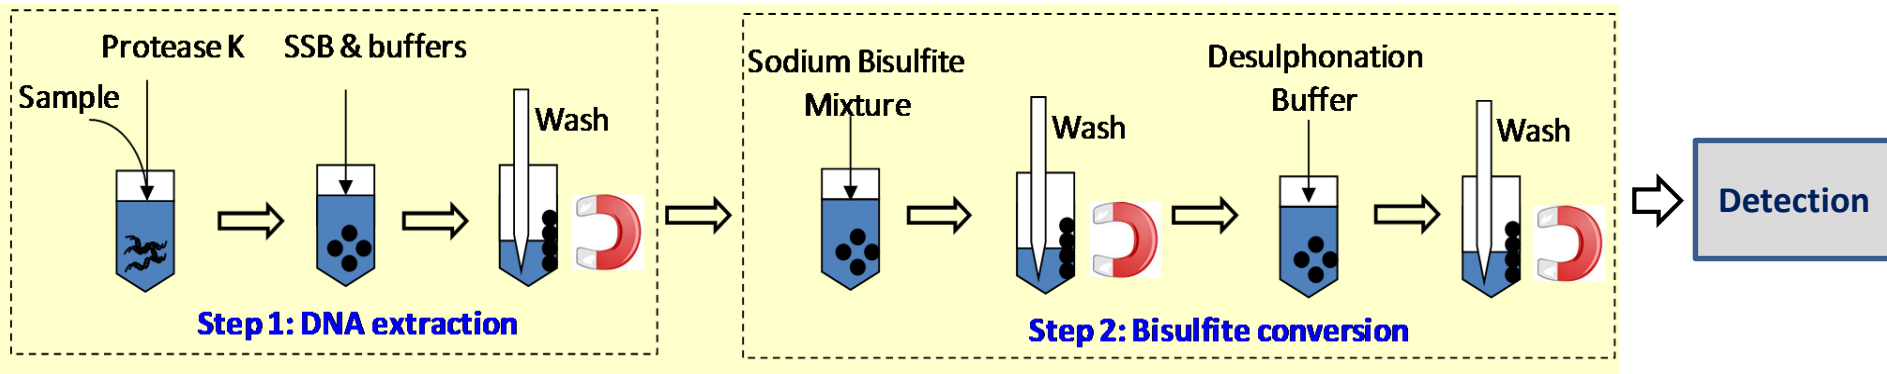

4 x 4,096 wells

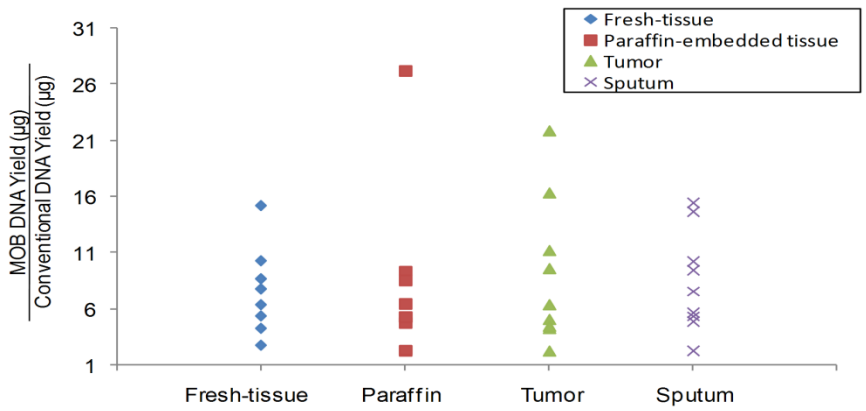

Integrate DNA Isolation and Bisulfite Conversion Using Silica Superparamagnetic Particles

Methylation on Beads (MOB)

- Induced magnetic property in a magnetic field, easy for manipulation
- Reversible DNA binding and desorption by tuning the buffer condition
- Small size provides large surface area for DNA binding
- Size varies from 10 nm to 1000 nm

Comparison of MOB and Conventional Method

Methylation Detection in Primary Tissue

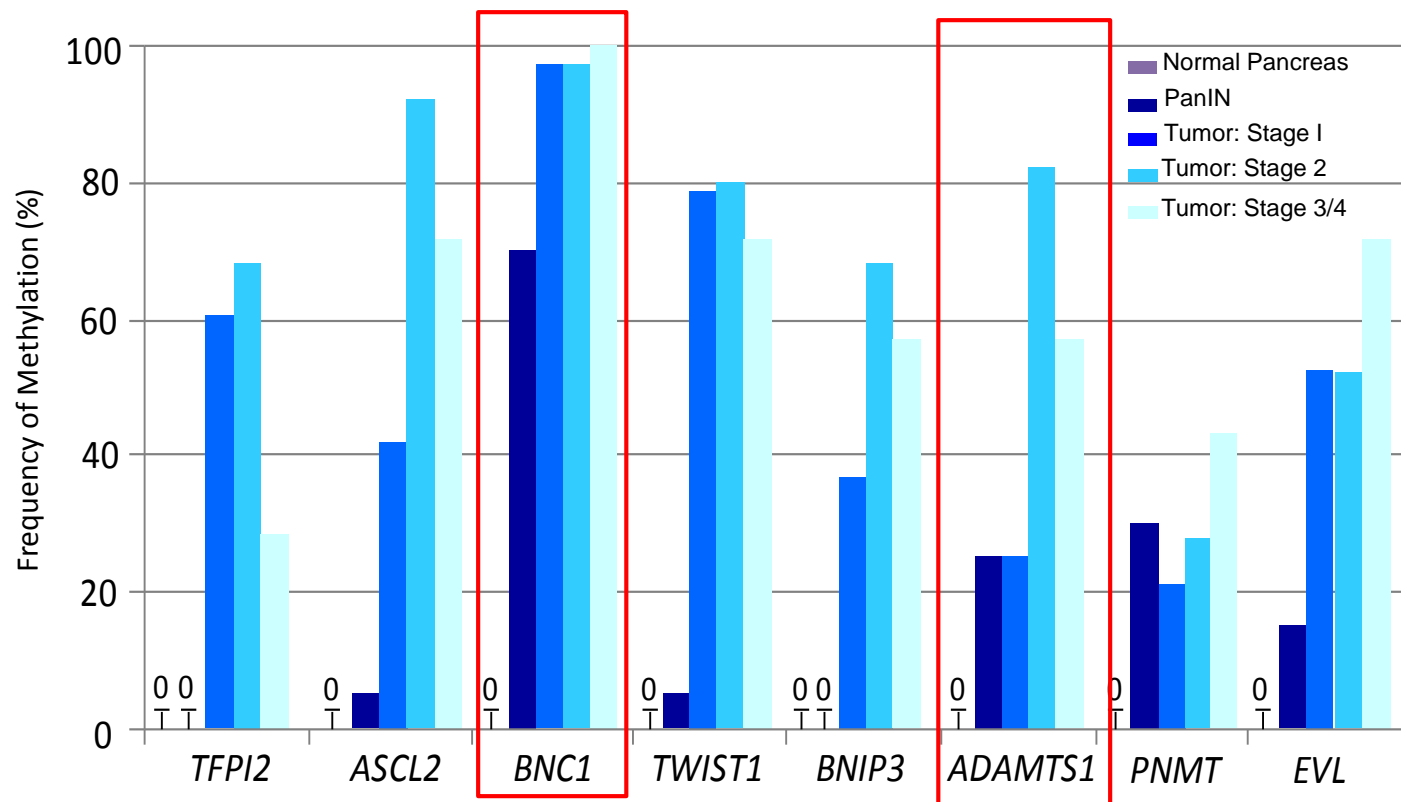

Table 1. Clinical information for primary pancreatic samples

	Pancreas Primary Tumors (N= 123)					
	Normal (N=4)	PanINs (N=20)	Stage I (N=38)	Stage II (N=78)	Stage III (N=5)	Stage IV (N=2)
Median Survival (months)		137.3	42.4	17.8	13.9	19.6

Methylation Detection in Sera

Table 2. Sensitivity and specificity of *BNC1* and *ADAMTS1* in pancreatic cancer patient serum samples

		<i>BNC1</i>		<i>ADAMTS1</i>		
Pancreatic Cancer		Sensitivity(%)				
Stage	n	Estimated Value	95% CI	Estimated Value	95% CI	
I	10	90% (9/10)		90% (9/10)		
II-IV	32	75% (24/32)		34% (11/32)		
Total	42	79% (33/42)	66-91%	48% (20/42)	33-63%	(84%) Overall
Normal		Specificity(%)				
	n	Estimated Value	95% CI	Estimated Value	95% CI	
	26	89%	76-100%	92%	82-100%	(85%) Overall

CI- confidence interval
